SUMMARY

Backend-focused Full Stack engineer experienced in building scalable RESTful APIs, system design, performance optimization, and caching strategies. Skilled in Redis, rate limiting, load testing, and containerized architectures using Docker.

TECHNICAL SKILLS

Languages: JavaScript (ES6+), Java

Backend: Node.js, Express.js, Scalable REST APIs, JWT Authentication, Rate Limiting, API Design

Frontend: React.js, Tailwind CSS

Database: MongoDB (Indexes, Aggregation), Redis (Caching, Rate Limiting)

DevOps & Tools: Docker, Docker Compose, Nginx, Git, GitHub, GitHub Actions (CI/CD)

Integrations: Stripe, Razorpay, Cloudinary

PROJECT EXPERIENCE

Buyora – Scalable Full Stack E-commerce Platform

Live URL | Github Repo

Tech Stack: React, Node.js, Express, MongoDB, Redis, Docker, Nginx, Stripe, Razorpay

- Designed a containerized modular architecture using Docker and Nginx reverse proxy, enabling secure internal API communication and service isolation
- Optimized backend performance using Redis cache-aside strategy, reducing API latency from 3s to 500ms (83%) and lowering database load
- Validated system performance under load using k6, reducing response spikes from 1s to 500ms and improving stability under concurrent traffic
- Implemented multi-layer security with JWT authentication and Redis-based rate limiting, protecting sensitive routes from brute-force and abuse

RideSync – Real-time Ride Booking Platform

Github Repo

Tech Stack: Node.js, Express, MongoDB, Socket.IO, Mapbox

- Built real-time ride booking system using Socket.IO, enabling live driver tracking and low-latency event-driven updates via room-based communication
- Implemented location-based driver matching using Haversine formula and dynamic fare calculation via Mapbox APIs
- Designed ride lifecycle state machine (request → accept → start via OTP → complete), identifying race conditions and optimizing database interactions

SigmaGPT – AI SaaS Platform with Credit-Based Monetization

Live URL | Github Repo

Tech Stack: Node.js, Express, MongoDB, Redis, Stripe

- Developed credit-based usage system with atomic updates and secure Stripe webhook integration, preventing duplicate credit allocation
- Implemented Redis-based distributed rate limiting (user/IP scoped) with fail-open strategy to maintain availability during failures
- Engineered backend with aggregation pipelines and robust error handling for API quota limits and Redis instability

EDUCATION

B.Tech in Computer Science

2023 – 2027

Adamas University

CGPA: 8.0 / 10.0
